

Floor drains
2014/2015

Alca PLAST® Academy

ŠKOLICÍ STŘEDISKO TRAINING CENTRE

QUALITY

ALCAPLAST company has implemented the ISO 9001:2008 quality management system and is certified by Det Norske Veritas.

Manufactured products are designed according to valid standards, and are also tested at every stage of development.

Czech Product

INNOVATION

At the beginning of 2012, a new modern production hall. ALCAPLAST production facilities therefore have expanded to about 30,000 square meters. Custom molds production, development work, utility models and patents along with the most modern machinery are the cornerstones of the successful growth of ALCAPLAST.

DYNAMIC

ALCAPLAST company is one of the largest manufacturers of sanitary ware in Central and Eastern Europe with its own branches in the Slovak Republic, Hungary, Poland, Romania and Belarus. In our company philosophy, design and quality play a vital and crucial role. The ALCAPLAST assortments of products were formed by many years of experience with regard to customer needs and requirements, new trends, market exposure while retaining an environmentally friendly stance.

Alcaplast floor drains

BATHROOM

TECHNICAL
AREAS

OUTDOOR
AREAS

ALCAPLAST floor drains are ideal solution for draining areas at a single point such as bathrooms, terraces, balconies, basements, boiler rooms, swimming pools, horizontal roofs and other places without traffic. Floor drains are suitable for new buildings, where they can provide the necessary pre-installation conditions, and for reconstruction due to their low installation height thus allowing for a seamless installation. Of course they are also compatible with all types of flooring materials such as concrete, plastic, wood, ceramic tiles etc.

PLACEMENT OF FLOOR DRAINS BY AREA

For easier and faster orientation in selecting the right ALCAPLAST drain for your application you can find the following table were for each type we have marked their recommended usage area.

For simplicity, these locations are divided into three categories – bathrooms, technical areas and outdoor areas. The bathroom category includes all areas with expected frequent usage and water flowing regularly into the drain. Technical areas are spaces that are used less frequently, like laundry rooms, boiler rooms and recreational facilities. Outdoor areas are all areas where there is chance for the temperatures to drop below zero degrees.

The individual components of ALCAPLAST drains are 100% interchangeable. Therefore, at any time you can replace the already installed odour trap with a different type and thus respond to the change in current conditions of use (regular waterflow, irregular waterflow, temperatures drop below freezing point).

Table of recommended locations for floor drains:

* Placement of floor drains depends on the choice of wet or dry trap, the chosen trap is included in the box.

** Drains contain combined trap **SMART**.

Advantages of Alcaplast floor drains

PERFECT
BONDING WITH THE
CONSTRUCTION SITE
WATERPROOFING

HIGH WATER FLOW

100% COMPATIBILITY
OF COMPONENTS

6 YEARS WARRANTY

PERFECT BONDING WITH THE CONSTRUCTION SITE WATERPROOFING

Perfect execution of waterproofing is the current trend in the construction industry, which uses modern technology, materials and design solutions.

ALCAPLAST has introduced new floor drain bodies, which have a wide collar designed to allow safe connection to the waterproofing of the construction site. If necessary, you can use a stainless steel flange, which strengthens the connection and secures it even more.

A novelty is also the collar – second isolation level, which allows the connection of the waterproofing layer applied directly under the tiles to the drain throat. The grout between the tiles is not waterproof, and with frequent use of the drain, leakage occurs in the layer between the base isolation and the floor tiles and thus causing damage. The collar – second level isolation could solve this problem.

HIGH WATER FLOW

The structural design of the odour trap and ALCAPLAST floor drain bodies ensures a high flow rate (up to 84 l/min). This is a condition in areas with intensive use of drains, such as shower enclosures with large format shower heads, but also in places where the drain safety feature against flooding is needed – such as laundries or boilers.

100% COMPATIBILITY OF COMPONENTS

Individual components of the ALCAPLAST floor drains are interchangeable.

This allows you during the installation process to flexibly respond to changing conditions and technical requirements for drain by replacing or adding suitable parts. Also with already installed drains you can later replace the removable parts with an alternative piece, which better suits the actual requirements.

6 YEARS WARRANTY

The material and technological processing of all the parts of the ALCAPLAST floor drains meets the highest requirements for modern building technology. Visible components contain a UV stabilizer which protects against aging, fading and degradation of plastic. Functional parts are made of materials that are highly resistant to mechanical, chemical and thermal damage.

Drains undergo regular stress tests and the entire production process is regularly checked by the quality department under the ISO 9001:2008 standard.

Technical solution of Alcaplast floor drains

1 GRID

You can choose from different sizes, materials and grid designs. Grid sizes are 102 × 102 mm or 143 × 143 mm. Grid materials can be polypropylene, polished AISI 304 stainless steel or eventually AISI 316 in particularly for aggressive environments (swimming pool water with chemicals etc.) or a design grid made from brass with a chrome plated finish that will complement the new modern style of any interior. Guaranteed maximum load capacity is 300 kg, corresponding to load class K3.

2 DRAIN THROAT

The drain throat, has a sufficient structural height of up to 95 mm. Grooves on the drain throat simplifies the cutting of the throat to the required height. Two vertical slots divert residual moisture that penetrates the joints between the tiles back into the drain body. The drain body is made from polypropylene, which contains UV stabilizers against aging, fading and degradation of plastic.

3 COLLAR-2ND LEVEL ISOLATION

The grout between the tiles is not waterproof, and with frequent use of the drain, leakage occurs in the layer between the base isolation and the floor tiles and thus causing damage. The collar – second level isolation allows for the waterproofing layer applied directly under the tiles to connect perfectly with the drain throat.

4 STAINLESS STEEL FLANGE

Stainless steel flange ensures that the drain connection to the waterproofing of the construction site is done with a waterproofing membrane.

5 DRAIN WIDE COLLAR

The wide drain collar, is designed so that it can be safely connected to the waterproofing of the construction site. The ribbing on the underside of the collar ensures a stable fit in the underlying material.

6 DRAIN BODY

The drain bodies are made from polypropylene, which is resistant to mechanical, chemical and thermal damage up to 95°C. Connection to the waste pipe is done with diameters of 75 mm or 50 mm. Overall installation height is 79 mm, and for the reduced height version it is 66 mm.

7 ODOUR TRAP

Selecting the odour trap is dependent on the intended use of the drain. We can choose between three basic types: water, mixed and dry.

Wet odour trap

The wet odour trap APV0010 is designed for areas where we expect frequent use with regular water flow into the drain. The level of the water seal in the trap is 50 mm, thereby conforming to DIN EN 1253. Water flow is 44 l/min.

Combined odour trap **SMART**

Combined odour trap **SMART** APV0020 is installed in bathrooms or areas where we do not expect regular use of the drain, and this leads to its drying (technical areas). The drain has a safety function against flooding. A mechanical flap prevents odours and water from rising up from the sewer. Flow rate is 31.2 l/min.

Dry odour trap

The dry odour trap APV0030 is designed for outdoor areas. Its mechanical flap prevents odours coming from the sewer. The flow rate is 80 l/min.

APV101

Floor drain 105 × 105/50 side outlet,
brass-chrome plate grid, wet odour trap

Connection	DN 50; side outlet; connection to HT pipes
Odour trap	Wet odour trap: water seal height 50 mm
Flowrate	Wet odour trap = 44 l/min.
Waterproofing	Isolating collar: wide enough for a reliable connection between the drain body and the construction site waterproofing; without any inner edges – it allows the residual humidity to be drained from between the tiles and the waterproofing into the drain body
Material	PP – polypropylene filled with talc – resistant to mechanical, chemical and thermal damage up to 95°C
Inlet	Frame 105×105 mm; grid 102×102 mm from 5mm chrome plated brass; height-adjustable throat 9–95 mm; grooves for drainage of residual humidity
Load class	K3 = max. 300 kg
Standard	ČSN EN 1253
Recommended for	Bathroom; technical areas
Included	Protective cover for the drain body
Carton	Packing 8 pcs.; dimension 780×245×475 mm; weight 8.2 kg

APV201

Floor drain 105 × 105/50/75 straight outlet,
brass-chrome plate grid, wet odour trap

Connection	DN 75 and DN 50; straight outlet; connection to HT pipes
Odour trap	Wet odour trap: water seal height 50 mm
Flowrate	Wet odour trap = 44 l/min.
Waterproofing	Isolating collar: wide enough for a reliable connection between the drain body and the construction site waterproofing; without any inner edges – it allows the residual humidity to be drained from between the tiles and the waterproofing into the drain body
Material	PP – polypropylene filled with talc – resistant to mechanical, chemical and thermal damage up to 95°C
Inlet	Frame 105×105 mm; grid 102×102 mm from 5mm chrome plated brass; height-adjustable throat 9–95 mm; grooves for drainage of residual humidity
Load class	K3 = max. 300 kg
Standard	ČSN EN 1253
Recommended for	Bathroom; technical areas
Included	Protective cover for the drain body
Carton	Packing 8 pcs.; dimension 780×245×475 mm; weight 8.3 kg

Floor drain 105 × 105/50 side outlet, stainless steel grid with combined odour trap **SMART**

Connection	DN 50; side outlet; connection to HT pipes
Odour trap	Combined odour trap SMART: water seal height 30 mm; with flap
Flowrate	Combined odour trap SMART = 31.2 l/min.
Waterproofing	Isolating collar: wide enough for a reliable connection between the drain body and the construction site waterproofing; with an inner edge
Material	PP – polypropylene filled with talc – resistant to mechanical, chemical and thermal damage up to 95°C; ABS
Inlet	Frame 105×105 mm; grid 102×102 mm made from stainless steel AISI 304; height-adjustable throat 9–95 mm; grooves for drainage of residual humidity
Load class	K3 = max. 300 kg
Standard	ČSN EN 1253
Recommended for	Bathroom; technical areas
Carton	Packing 20 pcs.; dimension 590×390×430 mm; weight 9.4 kg

APV32

Floor drain 105 × 105/50 straight outlet, stainless steel grid with combined odour trap **SMART**

Connection	DN 50; straight outlet; connection to HT pipes
Odour trap	Combined odour trap SMART: water seal height 30 mm; with flap
Flowrate	Combined odour trap SMART = 31.2 l/min.
Waterproofing	Isolating collar: wide enough for a reliable connection between the drain body and the construction site waterproofing; with an inner edge
Material	PP – polypropylene filled with talc – resistant to mechanical, chemical and thermal damage up to 95°C; ABS

INSTALLATION IN CONCRETE

- 1 Concrete screed
- 2 Waterproofing membrane AIZ
- 3 Waterproofing coating
- 4 Concrete screed
- 5 Glue
- 6 Tiles
- 7 Permanent elastic filler

Floor drain APV1324

INSTALLING INTO WOOD

- 1 Floor board
- 2 Screw
- 3 Collar-2nd level isolation
- 4 Waterproofing tape
- 5 Waterproofing coating
- 6 Glue
- 7 Tiles
- 8 Permanent elastic filler

Step-by-step floor drains installation

1 On the supporting structure (or the sound isolation), place the drain body without the trap and drain throat. Into the drain body insert the protective cover. Connect the drain to the sewer drain pipe.

2 Fill the area around the drain with concrete screed up to the isolating collar. After the concrete has dried, remove the protective cover. On the area around the drain body, apply penetration coating.

3 Apply on the area connecting between the isolation collar and the concrete the waterproofing tape. Then cover the entire surface with waterproofing paint or a waterproofing membrane.

4 Insert the odour trap.

5 Cut the drain throat to the required height. Move the o-ring to the lowest groove. Insert the drain throat into the drain body.

6 Insert the locking ring into the drain throat and turn it clockwise to lock the odour trap.

7 Slope the concrete screed surface towards the grid frame. For proper drainage of water it is necessary to comply with a 2% slope towards the drain.

8 Place the tiles up to the grid frame the joint between the frame and the floor tiles fill with a permanently elastic sealant.

9 Insert into the frame the grid.

Step-by-step floor drains installation with a stainless steel flange and a collar-2nd level isolation

1 On the supporting structure (or the sound isolation), place the drain body without the trap and drain throat. Into the drain body insert the protective cover. Connect the drain to the sewer drain pipe.

2 Fill the area around the drain with concrete screed up to the isolating collar. After the concrete has dried, remove the protective cover.

3 On the whole area around the drain body, apply penetration coating. In the waterproofing membrane cut an opening for the drain throat. Glue the membrane on the required area.

4 Attach the Stainless steel flange with screws to the drain body. This allows for a firm connection between the waterproofing and the drain. Insert the odour trap.

5 Cut the drain throat to the required height. Move the o-ring to the lowest groove. Install the collar-2nd level isolation. The height of the collar and the o-ring should be adjusted according to the thickness of the tiles. Insert the drain throat into the drain body.

6 Insert the locking ring into the drain throat and turn it clockwise to lock the odour trap.

7 Slope the concrete screed surface towards the collar-2nd isolation level. For proper drainage of water it is necessary to comply with a 2% slope towards the drain. On the area around the drain body, apply penetration coating.

8 Apply on the area connecting between the collar-2nd isolation level and the concrete the waterproofing tape. Then cover the entire surface with waterproofing paint or a waterproofing membrane.

9 Place the tiles up to the grid frame. The joint between the frame and the floor tiles fill with a permanently elastic sealant.

10 Insert into the frame the grid.

Technical solution for Alcaplast universal rain drums

BODY WITH HIGH
FLOW RATE

SECURE FLAP

COVER LOCK SYSTEM

1 BODY WITH HIGH FLOW RATE

The body of the rain drum is made from polypropylene reinforced with fiber glass. This makes it highly resistant to chemical, mechanical and thermal damage. Deeper and steeper gradient of the rain drum body enables a faster and bigger water flow towards the sewer. Flow rate can reach 550 l/min. Ribbing provides shape stability after concrete casting. Connection to the waste can be either side or straight. The straight connection has a diameter of either DN 110 or 125, or a universal option DN 125/110. Diameter DN 110 is suitable for draining a roof surface of 116 m². Diameter DN 125 is suitable for draining a roof surface of 190 m². The rain drum body comes in Black or Grey colours.

2 SECURE FLAP

The flap plays the role of a dry odour trap, prevents the rise of gases from sewer. It also prevents rodents from passing from the waste pipe. It closes with its own weight and is secured against flooding.

3 BASKET FOR CATCHING DIRT AND LEAVES

The basket catches coarse material (mainly leaves) and by doing so prevents the blocking of the waste pipe. Narrow ribbed bottom of the basket allows for a gradual dissepation of rotting leaves into the sewer. The basket can be easily removed and cleaned.

Stainless steel basket for catching dirt and leaves

As an accessory you can purchase a stainless steel basket for catching dirt and leaves, while it is also resistant to damage from rodents thus preventing them from accessing the roof downpipes. This basket is compatible with the majority of rain drums of the market.

4 INLET RINGS

Included in the box with each rain drum is a set of eccentric inlet rings. They are used to connect the roof downpipes of diameters 80, 90, 100, 110 and 125 mm to the rain drums. The material from which the inlet rings are made contains UV stabilizers against aging, fading and degradation of plastic. Frame and inlet rings are manufactured in black, gray or brick-red color. This makes it possible to combine the visible parts of the rain drum with the chosen color of the pavement.

5 COVER LOCK SYSTEM

Using the cover lock during heavy rain prevents the cover from opening and flooding the area around it. Also when locked it stops children from accessing the rain drum while playing. The cover and lock are available in black, gray or brick-red color. This makes it possible to combine the visible parts of the rain drum with the chosen color of the pavement.

Universal rain drum installation

Universal rain drum INSTALLATION

- 1 Soil
- 2 Coarse gravel
- 3 Fine gravel (sand)
- 4 Outdoor tiles
- 5 Universal rain drum

AGV1

Rain drum 300 × 155/110 straight outlet, black

Connection	DN 110; straight outlet; connection to HT pipes
Odour trap	Dry odour trap with flap
Flowrate	400 l/min.
Material	Black PP – polypropylene enriched with glass fibers – resistant to mechanical, chemical and thermal damage
Inlet	DN 125 or DN 80, 90, 100, 110 when using the appropriate eccentric pipe insert
Load class	K3 = max. 300 kg
Standard	ČSN EN 1451-1
Recommended for	Easy connection of the external pipe intended for collecting the rain water into the sewer to the drain
Included	Basket for collecting dirt, dry trap with a flap, sealing eccentric inserts for pipe diameters of DN 80, 90, 100, 110
Carton	Packing 5 pcs.; dimension 545×335×440 mm; weight 5.8 kg
Additional information	After installation, the visible part of the rain drum can be swapped for parts in grey or red color

Rain drum 300 × 155/125/110 side outlet, black

Connection	DN 110 po odříznutí DN 125; straight outlet; connection to HT pipes
Odour trap	Dry odour trap with flap
Flowrate	400 l/min.; 550 l/min.
Material	Black PP – polypropylene enriched with glass fibers – resistant to mechanical, chemical and thermal damage
Inlet	DN 125 or DN 80, 90, 100, 110 when using the appropriate eccentric pipe insert
Load class	K3 = max. 300 kg
Standard	ČSN EN 1451-1
Recommended for	Easy connection of the external pipe intended for collecting the rain water into the sewer to the drain
Included	Basket for collecting dirt, dry trap with a flap, sealing eccentric inserts for pipe diameters of DN 80, 90, 100, 110
Carton	Packing 4 pcs.; dimension 655×335×345 mm; weight 5.2 kg
Additional information	After installation, the visible part of the rain drum can be swapped for parts in grey or red color

Alca Shower drains

SHOWER DRAINS – MAXIMUM FLOWRATE 68 l/min.

Most shower drains on the market today use standard shower traps, for the shower trays, with limited access for cleaning and a low flow rate of around 30 l/min. ALCA shower drains, on the other hand, have a dual compartment trap specifically designed for this purpose and can reach flow rates of up to 68 l/min. This guarantees that no flooding will occur in your bathroom even when using big format shower heads with a very high flow rate of water.

ALCA SHOWER DRAINS HAVE FULLY CLEANABLE TRAPS

One odour trap is standard, but the ALCA shower drain utilise a two-flow compartment system, with removable inlet parts. This creates a dual odour trap system that allows simple and complete cleaning of both flow compartments as far as the waste pipe.

ALCA SHOWER DRAINS HAVE LOW INSTALLATION HEIGHT REQUIREMENTS

ALCA shower drains conform to today's high installation standards. The lowest installation height offered by ALCA drains is 55 mm, which is ideal for renovations in older houses with relatively shallow concrete floors. However, the 85 mm height is the preferred option for new constructions, where the height of the drain can be incorporated into the design.

25 YEAR WARRANTY

ALCA shower drains are made of high quality stainless steel and this, plus their construction, ensures they are highly resistant to damage. Electrochemical polishing prevents dirt from settling inside the channel and increases its resistance to corrosion and leaks. The bright metallic finish is free of any impurities and smoother than the original stainless steel material.

COMPLETE TECHNICAL AND DESIGN SOLUTIONS

The ALCA solutions offered here meet the most exacting requirements of all top architects and designers. There are shower drains specifically designed for free standing, wall mounted and corner shower installations, with different heights and also the Spa flow system. You can pick the grid of your choice from 30 basic designs, including both glass and artificial stone options.

CUSTOM MADE SOLUTIONS WITHIN 30 DAYS

All the standard ALCA drains can be custom made in any size, from 300 to 2,200 mm in length. Larger sizes, or a different solution to specific drainage requirements, can be supplied on an individual basis after discussion with our sales representatives. These tailor-made solutions will naturally retain the high performance characteristics and advantages of all ALCA shower drains.
